

### FEATURES

- Low offset voltage: 400  $\mu\text{V}$  maximum
- High current gain: 300 minimum
- Excellent current gain match: 4% maximum
- Low voltage noise density at 100 Hz, 1 mA  
3  $\text{nV}/\sqrt{\text{Hz}}$  maximum
- Excellent log conformance
  - Bulk resistance ( $r_{\text{BE}}$ ) = 0.6  $\Omega$  maximum
- Guaranteed matching for all transistors

### APPLICATIONS

- Low noise op amp front end
- Current mirror and current sink/source
- Low noise instrumentation amplifiers
- Voltage controlled attenuators
- Log amplifiers

### GENERAL DESCRIPTION

The MAT14 is a quad monolithic NPN transistor that offers excellent parametric matching for precision amplifier and nonlinear circuit applications. Performance characteristics of the MAT14 include high gain (300 minimum) over a wide range of collector current, low noise (3  $\text{nV}/\sqrt{\text{Hz}}$  maximum at 100 Hz,  $I_{\text{C}} = 1 \text{ mA}$ ), and excellent logarithmic conformance. The MAT14 also features a low offset voltage of 100  $\mu\text{V}$  typical and tight current gain matching to within 4%. Each transistor of the MAT14 is individually tested to data sheet specifications. For matching parameters (offset voltage, input offset current, and gain match), each of the dual transistor combinations are

verified to meet stated limits. Device performance is guaranteed at an ambient temperature of 25°C and over the industrial temperature range.

The long-term stability of matching parameters is guaranteed by the protection diodes across the base emitter junction of each transistor. These diodes prevent degradation of beta and matching characteristics due to reverse bias, base emitter current. The superior logarithmic conformance and accurate matching characteristics of the MAT14 make it an excellent choice for use in log and antilog circuits. The MAT14 is an ideal choice in applications where low noise and high gain are required.

## ABSOLUTE MAXIMUM RATINGS

Table 2.

Parameter	Rating
Voltage	
Collector-to-Base Voltage ( $BV_{CBO}$ )	40 V
Collector-to-Emitter Voltage ( $BV_{CEO}$ )	40 V
Collector-to-Collector Voltage ( $BV_{CC}$ )	40 V
Emitter-to-Emitter Voltage ( $BV_{EE}$ )	40 V
Current	
Collector Current ( $I_C$ )	30 mA
Emitter Current ( $I_E$ )	30 mA
Temperature	
Storage Temperature Range	-65°C to +150°C
Operating Temperature Range	-40°C to +85°C
Junction Temperature Range	-65°C to +150°C

Stresses above those listed under Absolute Maximum Ratings may cause permanent damage to the device. This is a stress rating only; functional operation of the device at these or any other conditions above those indicated in the operational section of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

## THERMAL RESISTANCE

$\theta_{JA}$  is specified for the worst-case conditions, that is, a device soldered in a circuit board for surface-mount packages.

Table 3. Thermal Resistance

Package Type	$\theta_{JA}$	$\theta_{JC}$	Unit

## ESD CAUTION

**ESD (electrostatic discharge) sensitive device.** Charged devices and circuit boards can discharge without detection. Although this product features patented or proprietary protection circuitry, damage may occur on devices subjected to high energy ESD. Therefore, proper ESD precautions should be taken to avoid performance degradation or loss of functionality.

**THEORY OF OPERATION**

**APPLICATIONS INFORMATION**

To minimize coupling between devices, tie one of the substrate pins (Pin 4 or Pin 11) to the most negative circuit potential. Note that Pin 4 and Pin 11 are internally connected.

**Applications Current Sources**

MAT14 can be used to implement a variety of high impedance current mirrors as shown in Figure 15, Figure 16, and Figure 17. These current mirrors can be used as biasing elements and load devices for amplifier stages.

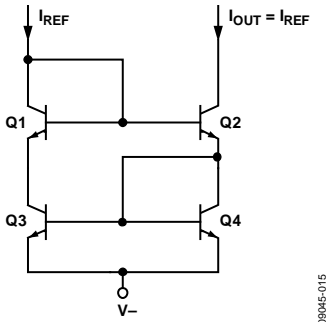

Figure 15. Unity-Gain Current Mirror,  $I_{OUT} = I_{REF}$

The unity-gain current mirror shown in Figure 15 has an accuracy of better than 1% and an output impedance of more than 100 MΩ at 100 μA.

Figure 16 and Figure 17 each show a modified current mirror; Figure 16 is designed for a current gain of two (2), and Figure 17 is designed for a current gain of one-half (1/2). The accuracy of

these mirrors is reduced from that of the unity-gain source due to base current errors but remains better than 2%.

Figure 16. Current Mirror,  $I_{OUT} = 2(I_{REF})$

Figure 17. Current Mirror,  $I_{OUT} = 1/2(I_{REF})$

Figure 18 is a temperature independent current sink that has an accuracy of better than 1% at an output current of 100 μA to 1 mA. A Schottky diode acts as a clamp to ensure correct circuit startup at power-on. Use 1% metal film type resistors in this circuit.
